

4.5V to 5.5V, 500kbps Full Duplex RS485 Transceivers

GENERAL DESCRIPTION

SiLM1415L is a noise-immune, full duplex RS485/RS422 transceiver designed to operate in rugged industrial environments. The bus pins of the device are robust to high levels of IEC electrostatic discharge (ESD) events. The fail-safe circuitry guarantees a logic high receiver output when the receiver inputs are open or short.

The SiLM1415L operates from a single 5V supply. It features an extended common-mode voltage range which makes it suitable for multi-point applications over long cable runs.

The SiLM1415L is available in MSOP10 package for space constrained applications and it supports ambient temperatures from -40°C to 125°C.

APPLICATION

- Motor driver
- Factory automation and control
- · Grid infrastructure
- Building automation
- HVAC systems
- Video surveillance
- Process analytics

FEATURES

- Meets or exceeds the requirements of the TIA/EIA-485 standard
- 500kbps data rates, full duplex
- 4.5V to 5.5V supply voltage
- Extended operational common mode range: ±15V
- Large receiver hysteresis for noise rejection
- Low power consumption
 - Standby supply current: <1uA
 - Current during operation: <2mA
- Ambient temperature: –40°C to 125°C
- Glitch free power up/down for hot plug-in capability
- · Open, short and idle bus failsafe
- 1/8 unit load (up to 256 bus nodes)

PIN CONFIGURATION

Package	Pin Configuration (Top View)	
MSOP10	R	10 VCC 9 A 8 B 7 Z 6 Y

PIN DESCRIPTION

No.	Pin Name	Description
1	R	Receive data output
2	RE	Receiver enable, active low, internal pull up.
3	DE	Driver enable, active high, internal pull down
4	D	Driver data input
5	GND	Device ground
6	Y	Digital bus output, Y (complementary to Z)
7	Z	Digital bus output, Z (complementary to Y)
8	В	Bus I/O port, B (complementary to A)
9	А	Bus I/O port, A (complementary to B)
10	vcc	Power supply

FEATURE DESCRIPTION

SiLM1415L is a full duplex RS-485 transceiver with data transmission up to 500 kbps. It has active-high driver enable and active low receiver enable. A standby current of less than 1 μ A can be achieved by disabling both driver and receiver. The SiLM1415L has a higher typical differential output voltage (Vod) than traditional transceivers for better noise immunity. A minimum differential output voltage of 2.1 V is specified with Vcc voltage of 5 V \pm 10% to meet the requirements of PROFIBUS applications.

The SiLM1415L provides internal biasing of the receiver input thresholds in combination with large input-threshold hysteresis. The receiver output remains logic high under a bus-idle or bus-short conditions without the need for external failsafe biasing resistors. Device operation is specified over a wide ambient temperature range from –40°C to 125°C.

Device Functional Modes

When the driver enable pin, DE, is logic high, the differential outputs Y and Z follow the logic states at data input D. A logic high at D causes Y to turn high and Z to turn low. In this case the differential output voltage defined as $V_{\text{OD}} = V_{\text{Y}} - V_{\text{Z}}$ is positive. When D is low, the output states reverse: Z turns high, Y becomes low, and V_{OD} is negative. When DE is low, both outputs turn high-impedance. In this condition the logic state at D is irrelevant. The DE pin has an internal pull-down resistor to ground, thus when left open the driver is disabled (high-impedance) by default. The D pin has an internal pull-up resistor to VCC, thus, when left open while the driver is enabled, output Y turns high and Z turns low.

Table 1. Driver function table for SiLM1415L

Input	Enable	Outp	outs	Function
D	DE	Y	Z	- Tunction
Н	Н	Н	L	Actively drive bus high
L	Н	L	Н	Actively drive bus low
Х	L	Z	Z	Driver disabled
Х	Open	Z	Z	Driver disabled by default
Open	Н	Н	L	Actively drive bus high by default

When the receiver enable pin, \overline{RE} , is logic low, the receiver is enabled. When the differential input voltage defined as $V_{ID} = V_{A} - V_{B}$ is higher than the positive input threshold, V_{TH+} , the receiver output, R, turns high. When V_{ID} is lower than the negative input threshold, V_{TH-} , the receiver output, R, turns low. If V_{ID} is between V_{TH+} and V_{TH-} the output is indeterminate.

When \overline{RE} is logic high or left open, the receiver output is high-impedance and the magnitude and polarity of V_{ID} are irrelevant. Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted to one another (short-circuit), or the bus is not actively driven (idle bus).

Table 2. Receiver function table for SiLM1415L

Differential Input	Enable	Output	
V _{ID} =V _A -V _B	RE	R	Function
V _{TH+} <v<sub>ID</v<sub>	L	Н	Receive valid bus high
V _{TH-} <v<sub>ID <v<sub>TH+</v<sub></v<sub>	L	unknow	Indeterminate bus state
V _{ID} <v<sub>TH-</v<sub>	L	L	Receive valid bus low
X	Н	Z	Receiver disabled

Х	Open	Z	Receiver disabled by default
Open circuit bus	L	Н	Fail-safe high output
Short circuit bus	L	Н	Fail-safe high output
Idle (terminated) bus	L	Н	Fail-safe high output

Receiver Failsafe

The differential receiver of the SiLM1415L is failsafe to invalid bus states caused by the following:

- · Open bus conditions, such as a disconnected connector
- · Shorted bus conditions, such as cable damage shorting the twisted-pair together
- · Idle bus conditions that occur when no driver on the bus is actively driving

In any of these cases, the differential receiver will output a failsafe logic high state so that the output of the receiver is not indeterminate.

Receiver failsafe is accomplished by offsetting the receiver thresholds such that the input indeterminate range does not include zero volts differential. In order to comply with the RS-422 and RS-485 standards, the receiver output must output a high when the differential input V_{ID} is more positive than 200 mV, and must output a low when V_{ID} is more negative than -200 mV. The receiver parameters which determine the failsafe performance are V_{TH+} , V_{TH-} , and V_{HYS} (the separation between V_{TH+} and V_{TH-}). As shown in the Electrical Characteristics (DC) table, differential signals more negative than -200 mV will always cause a low receiver output, and differential signals more positive than 200 mV will always cause a high receiver output.

When the differential input signal is close to zero, it is still above the V_{TH+} threshold, and the receiver output will be high. Only when the differential input is more than V_{HYS} below V_{TH+} will the receiver output transition to a low state. Therefore, the noise immunity of the receiver inputs during a bus fault condition includes the receiver hysteresis value, V_{HYS} , as well as the value of V_{TH+} .

TYPICAL APPLICATION

The SiLM1415L is a full-duplex RS-485 transceivers. It requires two signal pairs (four wires), and allows each node to transmit data on one pair while simultaneously receiving data on the other pair.

RS-485 bus consists of multiple transceivers connecting in parallel to a bus cable as shown in Figure 11. To eliminate line reflections, each cable end is terminated with a termination resistor, R_T , whose value matches the characteristic impedance, Z_0 , of the cable. This method, known as parallel termination, generally allows for higher data rates over longer cable length.
